

ICE BLOWING SYSTEM

Cantrell Ice Blowing Systems deliver ice from holding areas or ice makers to various designated drops through out the plant. These drops vary from box icers, to chillers, to combos, and etc. Ice blowing systems are mounted overhead where ice is delivered to the destination through a network of pipes and diverter valves managed by a central controller. The amount of ice delivered to the destination is adjustable therefore reducing the possibility of over-filling or under-filling. Where multiple types of destinations are needed on one system, a priority can be established so that product icing won't be compromised.

Unlike augers where preventative maintenance is constantly needed, Cantrell Ice Blowing Systems require little maintenance thanks to minimal moving parts and heavy duty, quality construction.
